

SECURITY OFFICER GUARDING

Access Control Application Note

Visitor access control scanning devices have now become an essential tool for every security officer posted at an entry or exit point facility of a site. These devices allow them to process and capture identification documents such as IDs, drivers' licenses, business cards and passports for visitors, delivery people, contractors and other unknown individuals.

EvTrack is also a tool for portable access control where a physical gate/door may not exist but where the customer would still like an access control record or audit trail at the site of individuals and vehicles. Other portable security guarding applications include event or conference security where access control points are manned by security personnel.

Time/attendance of security personnel, cleaning or gardening staff is also possible with a report by date and time spent onsite.

Features
