ID & Passport Scanning

To help automate and speed up visitor enrollment and data capture, EvTrack supports Emirates Id Cards & International Passports. All information is securely captured, transmitted and stored in an encrypted database by the EvTrack server. The visitor info can be retrieved by exporting a visitor report or viewing the visitor's individual profile via the web portal.

Visitor Self-Service Kiosk

EvTrack's FrontDesk Kiosk solution allows for unattended visitor registration in a reception area or lift lobby. On approval of the registration by the host, the kiosk can be configured to print, email or SMS a QR code which can be used on an EvTrack QR code reader to gain entry into a building. The Kiosk also Supports Pre-Registration.

Badge Printing

Various makes and models of printers are supported within EvTrack, from Evolis full color card printers to brother black/red thermal printers to standard Zebra receipt printers using low cost paper. Once a visitor registration has been completed the kiosk can be set to automatically print a visitor's badge.

QR Code Access Control

QR Codes are the perfect solution for guest access control for short term accommodation, contractor and corporate visitor requiring seamless access through layers of security. EvTrack automates the Access Control process by automatically creating the QR Code credential at the time of the visitor sign-in. This is then added to the Access Control controller for a limited period.

Guard Handheld Scanning

With the EvTrack Guard App, security officers can be equipped with a portable smartphone device that can be used to scan Emirates ID cards and capture vehicle numberplates of visitors. This device also support printing of visitor badges and scanning of pre-registered QR code visitor invitations.

Facial Recognition Integration

With biometric facial recognition installations, the face captured on the kiosk is uploaded to the facial biometric reader. This provides a seamless visitor to access control solution. Standard Android Tablets may be used or our special EvTrack Kiosk product. SAFR, Akuvox and Hikvision readers are supported.

Encryption & Security

Information security is critical to us and with EvTrack all data between the kiosk and server and the web portal browser is encrypted. This includes any data stored offline on the kiosk device. Custom public and private keys can also be added to the system based on the customer's security requirements.

Visitor Pre-Registration

To speed up visitor processing, hosts/residents can pre-register guests through our free app, via our web portal or through a public registration link. The visitor will receive a one-time-pin or QR code which can be entered on the visitor kiosk to gain access to the site.

REST-API

Our rest API allows integration between EvTrack and third party access/control or property management systems. This is ideal for automating the visitor process such as when used for short-term accommodation booking systems. Various commands are supported including the creation, updating and deletion of visitor credentials.

Access Control Hardware Support

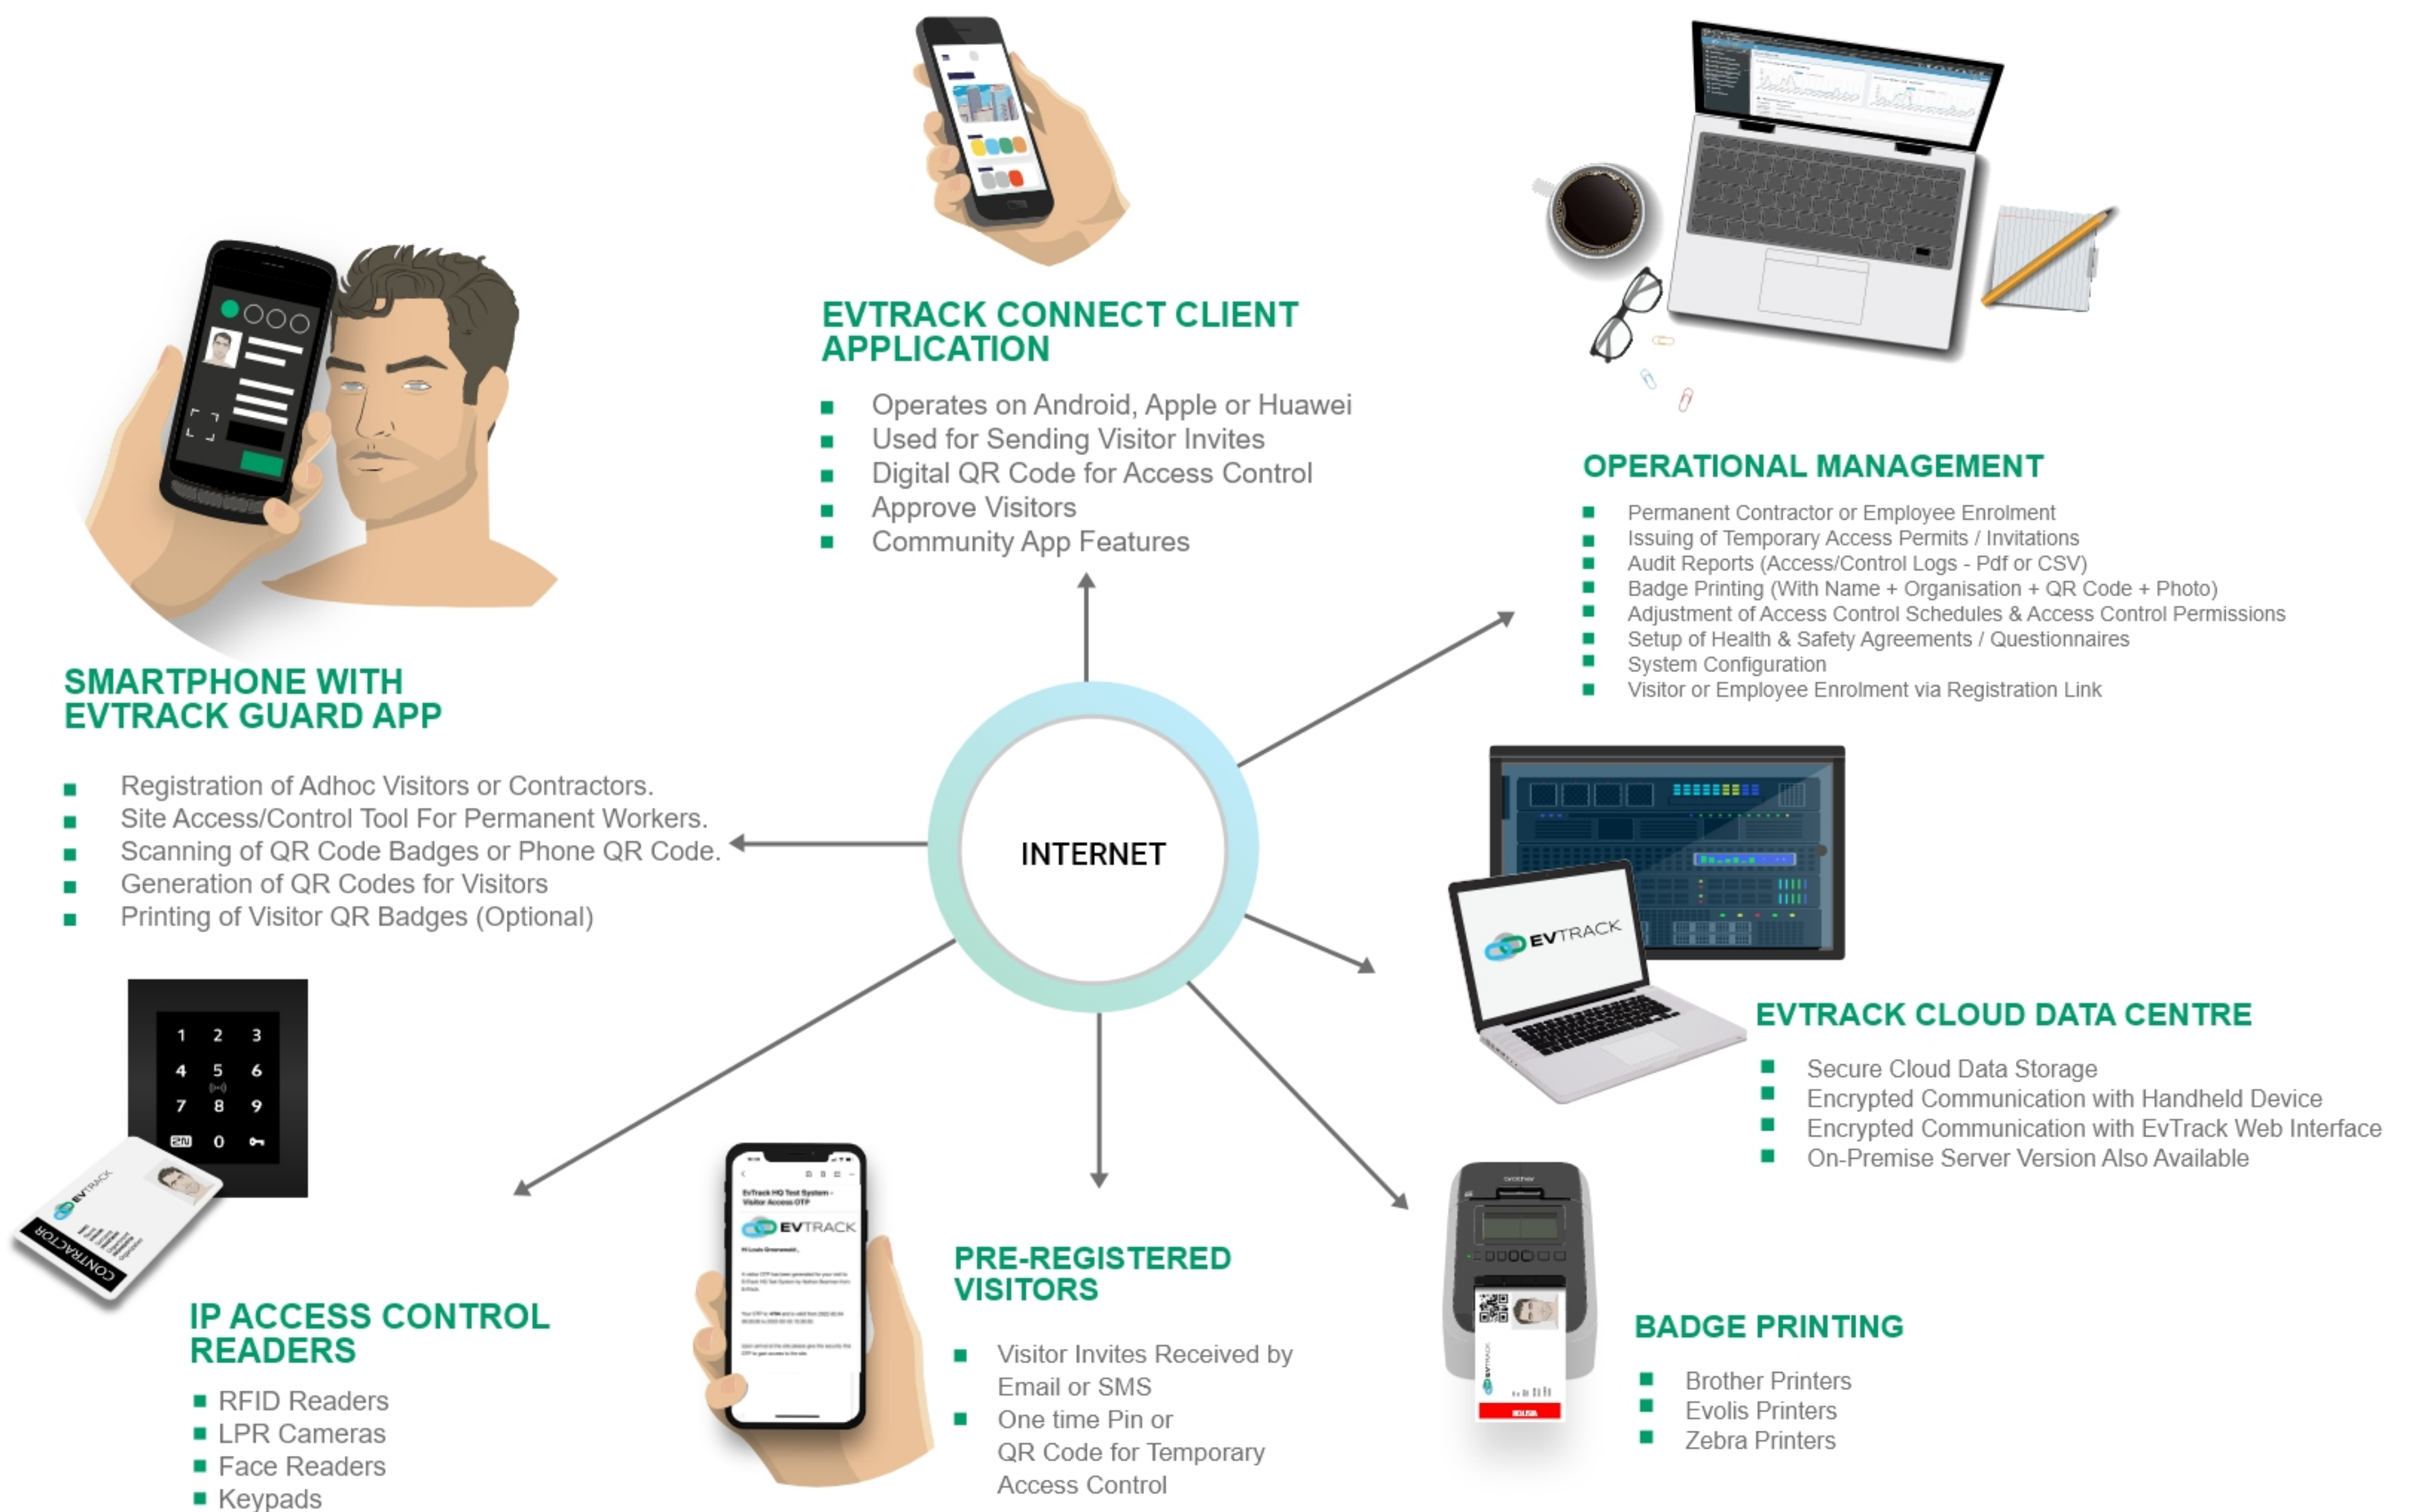

Akuvox
Open A Smart World

HIKVISION

EvTrack supports a wide range of Edge IP Access Control Devices Including QR code Readers, Face Readers, OTP Keypads, RFID Readers & LPR / ANPR Cameras.
